-07-19 01:35:48 What could be the problem? A: If you have your development environment configured to use the NVidia nvidia-docker2 driver instead of the nvidia-docker1 driver, you'll need to install nvidia-container-runtime, as it's that one that allows you to start containers with the nvidia-docker2 driver. From the nvidia-docker2 documentation: A container running on this driver should be able to access the physical NVIDIA GPU when the container is launched. To start and configure an

NVIDIA GPU-enabled container, use nvidia-docker2: docker run -it \ --env
JAVA_OPTS='-Djava.security.egd=file:/dev/./urandom' \ --volume=\$(pwd):/go/src/github.com/docker/docker/docker/daemon \
--volume=\$(pwd):/go/src/github.com/docker/docker/contrib/series:\$(pwd)/series \
--volume=\$(pwd):/go/src/github.com/docker/docker/daemon:\$(pwd)/daemon \
--volume=\$(pwd):/go/src/github.com/docker/docker/daemon/graphdriver:\$(pwd)/graphdriver \
--volume=\$(pwd):/go/src/github.com/docker/docker/daemon/execdriver:\$(pwd)/execdriver \ --volume=/dev/shm:/dev/shm:ro \
--volume=/sys:/sys:ro \ --volume=/tmp:/tmp:hostfs \ --volume=/var/lib/docker:/hostfs/var/lib/docker:rw \
--volume=/var/run:/hostfs/var/run:rw \ --volume=/var/lib/docker/plugins:/hostfs/var/lib/docker/plugins:rw \
--volume=/var/lib/docker/libcontainerd:/hostfs/var/lib/docker/libcontainerd:rw \
--volume=/var/lib/docker/selinux:/hostfs/var/lib/docker/selinux:rw \ --volume=/hostfs:/hostfs:ro \ --volume=/hostfs/etc/resolv.
