Prosthetic vascular access: what do patients think and do they know? Prosthetic vascular access has become a commonplace procedure. However, the reported rate of complications is high, and the patient's knowledge of the procedure has not been documented. Therefore, a questionnaire was sent to all patients who had received prosthetic vascular access at a single center. One hundred four of 196 (53%) patients returned the questionnaire; of these, 86% were undergoing dialysis with a vascular access and 12% with arteriovenous fistulas. The majority of patients were satisfied with their procedure, but 7% thought they might have benefited from the procedure. Complications were acknowledged by 70% of patients, and they were treated accordingly. Seventy-nine percent of the patients believed the access was a temporary measure. Twenty-one percent of patients had little or no knowledge of the complications. In conclusion, patients who had a vascular access constructed for temporary dialysis had little knowledge of the complications associated with the procedure. Q: $\lim_{n \rightarrow \infty} n(\sqrt{3 + 2/n} - 2) = \sqrt{3}$ I don't know how to prove this: Let $L = \lim_{n \rightarrow \infty} n(\sqrt{3 + 2/n} - 2)$
